

Additional instructions for the annotation of GNOME files

Ron Artstein

July 24, 2006

1. There are a number of pre-annotated attributes; you can generally ignore those. If you notice an error you can correct it.
2. The attribute ***On-map*** and the list of objects have been replaced with a free-text field in which you should enter a (brief!) description of the object. Don't forget to apply the changes.
3. There's a new level of markables called "unit"; these are not marked in the text, but can be selected. These should serve as segment antecedents, not utterances; you can change the utterance level to inactive in the markable level control panel.
4. Keep an eye out for ambiguities, in particular kind/object (for jewelry) and product/substance/object (for medical leaflets).
